Magurele, Romania

*International Conference on Nuclear Structure Properties  
June 28, 2022*

# Table of Contents

- ① Nuclear shapes
- ② Triaxial Nuclei
- ③ Energy spectra
- ④ Wobbling Motion
- ⑤ Simple wobbling - Energy spectrum
- ⑥ Results for even- $A$  nuclei
- ⑦ Conclusions

# Nuclear Deformation

- Most of the nuclei are either *spherical* or *axially symmetric* in their ground-state.
- Deformation parameter  $\beta$  (Bohr, 1969): preserves axial symmetry

Figure 1: **spherical:**  $\beta = 0$  **prolate:**  $\beta > 0$  **oblate:**  $\beta < 0$

# Nuclear Triaxiality

## Non-axial shapes

- Deviations from symmetric shapes can occur across the chart of nuclides → **triaxial nuclei**.
- The triaxiality parameter  $\gamma$  (*Bohr, 1969*): departure from axial symmetry

# Fingerprints for Triaxiality

- Stable triaxial nuclei represent a real challenge for experimentalists and theoreticians
- Clear signatures for confirming stable triaxiality in nuclei
  - ① Chiral symmetry breaking (*Frauendorf, 1997*)
  - ② **Wobbling motion** (*Bohr & Mottelson, 1975*)

## Wobbling Motion (WM)

- Unique to non-axial nuclei
- Predicted 50 years ago for even- $A$  nuclei (i.e., the simple wobblers)
- First experimental evidence for  $^{163}\text{Lu}$  (*Ødegård, 2001*)
- Currently confirmed wobblers  $A \approx [100, 130, 160, 180]$ .

# Triaxial Rotor Energy

- Rigid body rotational energy:  $E_{\text{rot}} \propto \frac{\hbar^2}{2\mathcal{J}_{\text{max}}} I(I+1)$
- A triaxial nucleus can rotate about any of the three axes  $\rightarrow$  *rich energy spectra*
- MOI anisotropy  $\rightarrow$  the *main rotation* around  $\mathcal{J}_{\text{max}}$  is disturbed by the other two axes  $\rightarrow$  **resulting motion of the rotating nucleus has an oscillating behavior**

Figures from Schönwaßer et al., 2001

# Wobbling Motion

- Oscillatory character of  $\mathbf{I} \rightarrow \mathbf{I}$  *disaligned* w.r.t. body-fixed axes
- The a.m. **precesses** and **wobbles** around the axis with  $\mathcal{I}_{\max}$
- The precession of  $\mathbf{I}$  can increase by **tilting**
- Tilting by an energy quanta  $\sim$  *vibrational character*  $\rightarrow$  **wobbling phonon**  $n_w = 0, 1, 2, \dots$

# Wobbling Spectrum

## Even-A Nuclei

- Employing the Harmonic Approximation (*Bohr, 1969*)
- $\hat{H}$  composed of a *rotational* part and *harmonic oscillation* (i.e., wobbling) part:

$$\hat{H} = \frac{\hbar^2}{2\mathcal{J}_{\max}} I(I+1) + \hbar\omega_{\text{wob}} \left( n_w + \frac{1}{2} \right), \quad n_w = 0, 1, 2, \dots \quad (1)$$

# Energy spectrum - simple wobbling

- Employed an energy spectrum of harmonic type according to Eq. 1:

$$E_I = \frac{\hbar^2}{2\mathcal{J}_3} I(I+1) + \hbar\omega_{\text{wob}} \left( n_w + \frac{1}{2} \right)$$

- $\hbar\omega_{\text{wob}}$  - **wobbling frequency** - linear dependence on  $I$  (fixed MOI ordering  $\mathcal{J}_3 > \mathcal{J}_{1,2}$ )

$$\hbar\omega_{\text{wob}}(I) = 2f(\mathcal{J}_1, \mathcal{J}_2, \mathcal{J}_3) \cdot I$$

- New experimental measurements show *potential* wobbling candidates in the  $A \approx 130$  region
- Three even- $A$  are studied with the *simple wobblers* formalism
  - 1  $^{130}\text{Ba}$  (*Petrache et al. 2019*)
  - 2  $^{134}\text{Ce}$  (*Petrache and Guo, 2016*)
  - 3  $^{136}\text{Nd}$  (*Lv et al., 2018*)
- Study the excited spectra: *theoretical model checks the data?*

## Harmonic Approximation

- Reproduced the excited spectra for the wobbling bands
- Employ a *free parameter set*:  $\mathcal{P} = [\mathcal{J}_1, \mathcal{J}_2, \mathcal{J}_3]$
- Adopt a fitting procedure:

$$\chi^2 = \frac{1}{N_T} \sum_{i=1}^{N_T} \frac{\left(E_{\text{exp}}^{(i)} - E_{\text{th}}^{(i)}\right)^2}{E_{\text{exp}}^{(i)}} \quad (2)$$

- $N_T \rightarrow$  total number of wobbling states within the nucleus

# New Results for $^{130}\text{Ba}$

## Recent findings for even-even nuclei

- Two wobbling bands have been identified experimentally in  $^{130}\text{Ba}$  (*Petrache et al., 2019*)
- DFT+PRM description of the wobbling motion described the excited spectra (*Chen et al., 2019*)
  - Reproduced experimental energies
  - Obtained deformation parameters self-consistently
  - Stable triaxiality for  $\beta = 0.24$  and  $\gamma = 21.5^\circ$

Figure from Petrache et al., 2019

# New Results for $^{130}\text{Ba}$ II

## Results for $^{130}\text{Ba}$ PRELIMINARY!

- $\mathcal{I}_1 : \mathcal{I}_2 : \mathcal{I}_3 \rightarrow 27 : 22 : \mathbf{43}$
- Maximal MOI is  $\mathcal{I}_3 > \mathcal{I}_{1,2}$

# Electromagnetic Transitions $^{130}\text{Ba}$

- In the harmonic approximation, the three MOI are used to determine  $B(E2)_{\text{out}}$
- $\beta_2$  and  $\gamma$  are taken from Chen et al.  $\rightarrow (\beta, \gamma) = 0.24, 21.5^\circ$   
 $\rightarrow$  used to calculate the quadrupole components  $Q_{20}$  and  $Q_{22}$
- $B(E2)_{\text{out}}(I) = \frac{5}{16\pi} I^{-1} (\sqrt{3} Q_{20} \cdot f(\mathcal{J}) + \sqrt{2} Q_{22} \cdot g(\mathcal{J}))$

| $I$ | $B(E2)_{\text{out}}/B(E2)_{\text{in}}$ |      |      |
|-----|--|------|------|
|     | Th.                                    | PRM* | Exp. |

| 21  | 0.19                                   | 0.25 | 0.41 |
| 23  | 0.18                                   | -    | -    |
| 25  | 0.16                                   | -    | -    |

# New Results for $^{134}\text{Ce}$

- Petrache et al. found two sets of wobbling bands in  $^{134}\text{Ce}$
- Wobbling confirmed in odd- $A$   $^{135}\text{Pr}$  by Matta et al. 2015  $\rightarrow$  *even- $A$  neighbor also with wobbling character?*
- The *isomer structure* is based on a  $10^+$  level with lower quadrupole deformation but higher life-time

# New Results for $^{134}\text{Ce}$ II

- Separate fitting procedures for the *isomer* and *deformed*
- Isomer:  $(\beta, \gamma) = (0.14, -35^\circ)$ ,  $E_{\text{RMS}} \approx 90$  keV
- Deformed:  $(\beta, \gamma) = (0.22, 25^\circ)$ ,  $E_{\text{RMS}} \approx 60$  keV

- isomer:  $\mathcal{J}_1 : \mathcal{J}_2 : \mathcal{J}_3 \rightarrow 14 : 21 : \mathbf{34} \hbar^2 \text{MeV}^{-1}$
- deformed:  $\mathcal{J}_1 : \mathcal{J}_2 : \mathcal{J}_3 \rightarrow 15 : 23 : \mathbf{42} \hbar^2 \text{MeV}^{-1}$

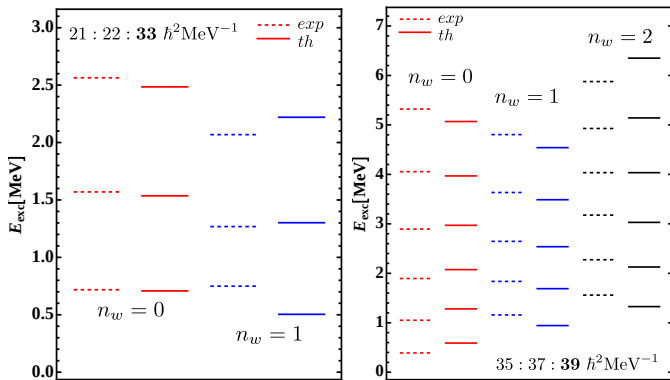

# New Results for $^{136}\text{Nd}$

- Lv et al. found two sets of wobbling bands in  $^{136}\text{Nd}$  → worth investigating  $A = 137$  neighbor nuclei ?
- *low/high* is used to differentiate the energy of  $10^+$  state of each structure
- The higher structure has two phonon excitations

# New Results for $^{136}\text{Nd}$ II

- Separate fitting for each structure (low/high)
- Low:  $(\beta, \gamma) = (0.15, -35^\circ)$ ,  $E_{\text{RMS}} \approx 120$  keV,
- High:  $(\beta, \gamma) = (0.21, 25^\circ)$ ,  $E_{\text{RMS}} \approx 145$  keV

# Conclusions & Future Outlook

- New wobbling nuclei were investigated through a semi-classical formalism
- The harmonic approximation reproduces the experimental data of even- $A$  wobbling nuclei
  - One wobbling structure for  $^{130}\text{Ba}$
  - Two wobbling structures for  $^{134}\text{Ce}$  and  $^{136}\text{Nd}$
- Quality of the fit was reflected in the transition probabilities for  $^{130}\text{Ba}$
- Calculations were done for fixed deformation parameters
- + Employ spin-dependence for the moments of inertia
- + Find classical trajectories *Poenaru R, Raduta A A, IJMP 2021*

Thank you for your attention!
